

Hospital Portal

Regional Hospital

A Regional Hospital wanted to develop online systems that would improve efficiencies, and provide better access for both their patients and employees. Through a web-portal the hospital wanted to let visitors know that it was more than a hospital, rather it is an integrated healthcare delivery system.

xwave designed and built a user-centered interface with a clean, easy to navigate homepage that provides links to each of the hospital's core services. Staff can easily and efficiently manage content for online news, job listings, the physician's directory and health tips. Site visitors can also create greeting cards which can be sent directly to patients.

The hospital also utilized **xwave** to build a state-of-the-art intranet to help communications for its 3500 online employees. Modules include event calendars, announcements, newsletters, reference library, policies and procedures, staff directory, cafeteria menu, and job listings. The staff have complete control over the content of their intranet.
