

# Regional Accessible Cardiac Health Record

## Regional Cardiac Center

In order to increase patient access and accountability, a Regional Cardiac Center wanted to replace a paper-based process for referring patients from hospitals in two different provinces.

A system was needed to provide authorized healthcare workers in hospitals and clinics with immediate and secure access to cardiac health records of patients at the Center who have catheterization, percutaneous coronary intervention, or cardiac surgery.

The Center turned to **xwave** to design, develop and implement a Regional Accessible Cardiac Health Record system. Overall, the system improves the collection and flow of cardiac care information among hospitals in region resulting in minimal delays and improved service, with costs remaining at current levels.
