

HEALTHCARE SOLUTIONS: Telehealth Solutions

Every Canadian needs equal access to health and wellness services regardless of where they live. Tremendous advances in healthcare technology are making it possible for anyone to consult a medical professional, anytime, anywhere, with no travel required.

Telehealth Solutions are making it possible to connect more people to the healthcare services they deserve with constantly growing efficiency.

Healthcare that goes the Distance

We have the expertise to design transition strategies for comprehensive Telehealth Solutions, with decades of industry experience, and the support of over 200 healthcare technology practitioners including strategists, consultants, physicians, RNs, and systems developers. From strategy to system development, to implementation, each step in the process presents unique challenges. We understand the vision for Telehealth, and we can help overcome some of challenges that can hinder its progress. To that end, we help:

- Determine new models for policy and legislation to enable Telehealth.
- Bring Telehealth front and centre and promote it as a viable option at the disposal of healthcare practitioners.
- Ease the adoption of new technology. Recipients of Telehealth care need to understand and be assured that they are getting the same quality of care as they would with traditional visits.
- Ensure that standards of care are preserved as Telehealth is implemented and put to use.
- Integrate Telehealth Solutions with Electronic Health Records.
- Assess the feasibility of Telehealth Solutions in regions with varying levels of technology infrastructure.
- Enable collaboration between healthcare professionals in different locations.

Telehealth Supports Patients at All Points of Care

Telehealth Solutions deliver value for the user, the provider and the funder by leveraging critical human resources and using technology to increase levels of care to patients:

- Telehealth can be used for diagnostics, treatment, and follow-up care. It can be used to deliver almost any service/specialty, to any age group from newborn to elderly.
- With an aging population, in the future there will be a greater focus on home healthcare, made possible in part by Telehealth.

We Support All Aspects of Telehealth

We work with healthcare decision makers at both the regional and jurisdictional levels, to develop well-designed plans for change. We develop a roadmap to ensure the rollout of

a Telehealth strategy is properly executed and managed, supports the jurisdictional health plan, and respects the principles of interoperability and collaboration within the jurisdictional context.

We conduct detailed assessments of our client's particular needs, identifying their pressures and areas of concern. We actively engage the key communities of interest for critical input in the planning process and conduct interviews and workshops with key stakeholders like clinicians, administrators, and ministries of health among others. Our recommendations can include a view of your future state along with the technology required to enable it.

We provide leadership in designing a strategic plan that identifies what is needed to integrate Telehealth into the healthcare system. We are committed to Telehealth becoming a means of delivering services that is transparent to service providers and users.

What is Telehealth?

Telehealth Solutions use Information and Communications Technology to deliver healthcare services and information over large and small distances. Delivered as high-speed voice/data, images, or simple telephone conversations, Telehealth brings care to patients where they live. It can mean video-monitoring of home-care patients, a remote diagnosis by a specialist, or 24/7 availability of registered nurses over the phone. Our expertise in Telehealth Solutions helps providers bring quality care to their patients.
